

What role do simulations play in engaging students?

The Team

Paul Driver:
Director of Simulation-
based Learning

Dr Marques Hardin:
Learning Technologist
for Simulation

Consider:

What are videos good for?

What are slides good for?

What are demonstrations good for?

What are field trips good for?

**What are simulations good for
(in your context)?**

Aims of simulation-based learning

The simulation-based learning team in works collaboratively with academic colleagues to develop engaging digital **proxies** for practical experiences that a student is expected to encounter in real-life settings during their career.

We help with the identification of new opportunities to introduce simulation, advise on learning design and co-create scenario-based experiences.

Authenticity and Buy-in

Simulations work best if learners buy into the premise. As such, one of the key challenges associated with building a successful simulation is crafting a learning environment that promotes student investment in the experience.

Many simulations are designed to offer learners a window into the interactions they will likely encounter in employment; therefore, their success as pedagogical interventions can hinge on their ability to authentically replicate these real-world interactions.

AI Co-development

Digital Humans

Simulated peer & service user engagement

We can utilise a combination of photographs, audio recordings, artificial intelligence & digitally-generated humans to simulate encounters that may be experienced in the real world, but typically inaccessible to our students.

Simulation-based learning involving virtual service users has been shown to increase clinical reasoning capabilities among students (Watari, et al., 2020).

- Consolidation

A low-tech storyboarding technique

Branching scenarios with decision making

Basic Branching Scenario Structure

Planning a Branching Scenario

Choice Architecture

In the context of branching narrative simulations, the term “choice” refers to the kinds of decisions, challenges or actions the learner can undertake that can *alter the course* of the scenario.

Choices (and story elements) can link together in various ways to form basic patterns. Each one has its advantages and disadvantages, and will produce a different experience for the learner.

a) linear

b) branching

c) branch and merge

d) hub and spokes
